The invention describes a recombinant DNA construct comprising a conjunct consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at consisting of a sequence encoding an amino acid sequence conversion of the invention are also useful in physical arrays of molecules and as conjunction are also useful in physical arrays of molecules and as conjunction of the conjunction are also useful in physical arrays of molecules and as conjunction of the conjunction of the conjunction of the conjunction of the cell cycle pathway, for conferring conjunction of the cell cycle pathway, for conferring conjunction of the cell cycle pathway, for conferring conjunction of plant disease, for producing galactomannan, conjunction in plants, for improving yield by modification of conjunction of plant for improving yield by modification of conjunction or for modifying seed oil or process under at least one stress condition or for modifying seed oil or process insert content. This sequence represents a plant full length insert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; drought tolerance; herbicide tolerance; extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance; galactomannan production; lignin production; plant growth regulator; yield; plant growth; plant development; seed oil; protein yield; protein content; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens pests, for conferring increased resistance to plant disease, or for
                                                                                                                                                                                                                                                                                                                                                            Claim 1; SEQ ID NO 26848; 15pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (LIUJ/)

The polynucleotide CC of the invention are also useful in physical arrays of molecules and as CC plant breeding markers. The recombinant DNA construct is useful for CC improving plant tolerance to cold, heat, drought, herbicides, extreme CC commotic conditions, pathogens or pests, for manipulating growth rate in CC plant cells by modification of the cell cycle pathway, for conferring CC increased resistance to plant disease, for producing galactomannan, CC lignin or plants, for improving yield by modification of plants, for improving yield by modification of plants or providing improved plant growth and development under at least one crombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake cor by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert

                                                New recombinant DNA construct, useful for improving plant tolerance cold, heat, drought, herbicides, extreme osmotic conditions, pathoge pests, for conferring increased resistance to plant disease, or for improving yield.
 The invention describes a recombinant DNA construct comprising

```

```
CC polynucleotide consisting of a sequence encoding an amino acid sequence cavailable in electronic form from the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide cof the invention are also useful in physical arrays of molecules and as improving plant tolerance to cold, heat, drought, herbicides, extreme combinitions, pathogens or pests, for manipulating growth rate in cold increased resistance to plant disease, for manipulating growth rate in increased resistance to plant disease, for producing galactomannan, cold increased resistance to plant disease, for producing galactomannan, cold increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert of the invention.

This invention relates to novel isolated, enriched or purified nucleic caid molecules that encode kinase polypeptides. Specifically, it refers to a bioinformatics strategy used to identify mammalian members of the protein and lipid kinase families. The present invention provides methods cfor identifying a substance that modulates the activity of a kinase collection of a kinase explicitly peptide, as well as a method for the detection of a kinase mucleic acid in a sample as a diagnostic tool for a disease or disorder.

CC disrupted by recombination at a nucleic acid sequence such that it croduces a phenotype, relative to the wild-type, that exhibits an absence of kinase activity. The nucleic acids and polypeptides given in the specification are useful for the diagnosis and treatment of cancer, central or peripheral nervous system diseases, psychotic and neurological disorders, neurodegenerative diseases, metabolic disorders, can be used for come a thorapy purposes and compositions. As such, they can be used for come a thorapy purposes and compositions as which they can be used for gene therapy purposes and compositions exhibit cytostatic, antimigraine, analgesic, endocrine-Gen., nootropic, tranquilizer, hypotensive, hypertensive, neuroprotective, antiparkinsonian, virucide, fungicide, antibacterial, antidiabetic, anorectic, antiarteriosclerotic, ophthalmological, antinflammatory, antiarthritic, antirheumatic, antiasthmatic, osteopathic, antiporiatic, immunosuppressive, cardiantgen, vasotropic, antiallergic and gastrointestinal-gen. This polynucleotide is a cDNA sequence that encodes a murine protein kinase c

The nucleic acids CC and the protein kinases they encode may be used in the treatment and CC diagnosis of diseases associated with inappropriate kinase expression CC such as immune-related diseases and disorders, cardiovascular disease, complementary sequences may also be used as DNA probes in disgnostic CC complementary sequences may also be used as DNA probes in the production CC assays. The kinase expression and activity. Anti-kinase antibodies of kinase expression and activity. Anti-kinase antibodies CC antibodies of kinase expression and activity. Anti-kinase antibodies CC expression and activity. Diseases related to down regulate kinase CC expression and activity. Biseases related to kinase expression and CC activity include rheumatoid arthritis, atherosclerosis, autoimmune CC disorders, complications of organ transplantation, myocardial infarction, immune disorders, cardiomyopathies, strokes, renal failure, oxidative-cc stress related disorders, chronic inflammatory bowel disease, chronic inflammatory bowel disease, chronic plantation, rhinitis, autoimmunity, diabetes, cancers and reproductive

                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a compound comprising a sequence comprising 8-80 base pairs (Dp) targeted to a nucleic acid encoding MARK3 (MAP/microtubule affinity-regulating kinase 3), that specifically hybridises with the nucleic acid encoding MARK3 and inhibits expression of MARK3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of MARK3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with MARK3 and screening for an antisense compound. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative diseases, particularly cancer and neurodegenerative diseases e.g. Alzheimer's disease. The present sequence is a MARK3 associated CDNA included in the figures but not mentioned anywhere else in the
                                                                                                                                                                                                                                                                                                                                                    No.:

                                                                        This invention relates to a novel screening method identified as a multi-
CC parameter high throughput screening (MPHTS) assay. Specifically, it
CC refers to an assay that utilises the disease signature of a plurality of
CC specific genes associated with a particular disease, and identifies
CC differential expression between those cells taken from individuals
CC affected by that disease and those that are not affected. The present
CC compounds to identify those that have a potential therapeutic benefit for
CC the treatment of neuropsychiatric and neurodegenerative disorders
CC this invention the said Alzheimer's disease. Accordingly, the compounds
CC well as Parkinson's and Alzheimer's disease. Accordingly, the compounds
CC of this invention exhibit various activities including neuroleptic,
CC nootropic, antinanic and antidepressant. Furthermore, the screening
CC method used in MPHTS will be automated, such that a large number of test
CC compounds may be rapidly screened with a minimal amount of labour and
CC differentially expressed in in the presence of the therapeutic compound
CC valproate, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  25-SEP-2001;

The present sequence is that of cDNA encoding human nuclear receptor CC binding protein 2 (NRBP2). The inventors have discovered genes that CC modify the RAC GTPase pathway in Caenorhabditis elegans and identified their human orthologs as NRBPs. The inventor provides methods for using these RAC modifier genes and polypeptides to identify NRBP-modulating CC agents that are candidate therapeutic agents that can be used in the CC treatment of disorders associated with defective or impaired RAC function or NRBP polypeptides and restore RAC function. Other preferred NRBP-cC modulating agents are nucleic acid modulatons such as antisense oligomers and RNAi that repress NRBP gene expression or product activity. NRBP-cC modulating agents may be evaluated by in vitro or in vivo assay for controls are identified as candidate RAC modulating agents. The assay system relative to controls are identified as candidate RAC modulating agents. The assay CC system may be cell-based or cell-free. NRBP modulating agents include totherapeutics), NRBP-specific antibodies, NRBP-specific antibodies, NRBP-specific antibodies, where assay for colidancers and other nucleic acid modulators, and chemical agents that colidancers and other nucleic acid modulators, and chemical agents that colidancers and other nucleic acid modulators, and chemical agents that colidancers and other nucleic acid modulators, and chemical agents that colidancers and other nucleic acid modulators, and chemical agents that colidancers and other nucleic acid modulators, and chemical agents that colidancers and other nucleic acid modulators, and chemical agents that colidancers and other nucleic acid modulators, and chemical agents that colidancers and other nucleic acid modulators, and chemical agents that colidancers and chemical agents assay as coll proteins assay, a cell colidancers and collection assay, a cell colidancers and collection assay.

A method for diagnosing a disease, especially cancer, in a patient uses a cross of the collection assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a candidate RAC pathway modulating agent using a nuclear receptor binding protein (NRBP) polypeptide or nucleic acid, useful for diagnosing or treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 2; SEQ ID NO 2; 51pp; English

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tang
Ma Y,
                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding polypeptides with in diagnosis and gene therapy.

```

The present invention relates to human protein kinase. The proteins are from new human genes termed h12832, h14138, h14833, h15990, h15993, h16341 and h2252. The proteins may be used to identify modulators of their activity. The proteins may also be used to derive products for the treatment of cellular growth related disorders, malignancies, cancers, immune, inflammatory, respiratory, haematological and bone-related

                                                                                              CC length cDNAs defined in the specification. Where a primer set complises:

CC (a) an oligo-dT primer and an oligonucleotide which comprises one of the 5602 complementary strand of a polynucleotide which comprises one of the 5602 cc complementary strand of a polynucleotide comprises one of the 5602 cc oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end cc complementary to a sequence and an oligonucleotide comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the compount of the 5'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in cc gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers era also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC CNASS easily without any specialised methods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Alignment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         foetal brain, foetal kidney, melanoma, testis and amygdala cDNA libraries. ABA93702 to ABA93766 represent human cDNA sequences from the present invention which encode the proteins given in ABB0562 to ABB05729. The human cDNA sequences and clones can be used in gene therapy. The clones may be used in a variety of applications, for example they may be used in profiling assays, for providing large arrays of human genetic material for implementing large-scale screening strategies and
